CSC116 Database

A database is an electronically stored, systematic collection of data that can include words, numbers, images, videos, and other types of files.

Column Name	Data Type	Description
patient_id	INT (PRIMARY KEY)	Unique ID for the patient
first_name	VARCHAR(50)	Patient's first name
last_name	VARCHAR(50)	Patient's last name
date_of_birth	DATE	Patient's date of birth
gender	VARCHAR(10)	Gender of the patient
phone_number	VARCHAR(15)	Contact phone number
email	VARCHAR(100)	Email address
address	VARCHAR(255)	Home address
emergency_contact	VARCHAR(100)	Emergency contact person

                                                    );
  emergency contact VARCHAR(100)
);
```

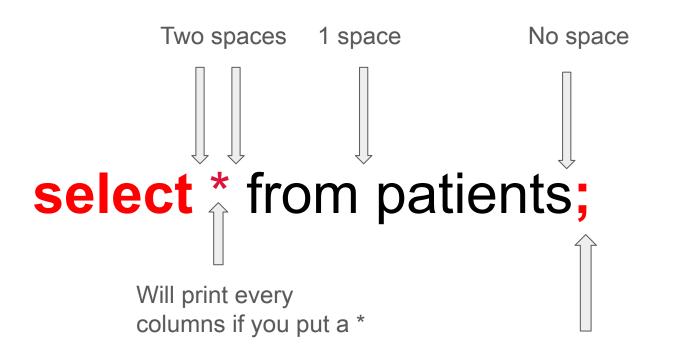

SQL

SQL is a standard language for storing, manipulating and retrieving data in databases.

Query Delete Insert Update

Query

```
select * from patients;
select * from docters;
select patient_id, gender, email from patients;
```

End of query

reason, appointment_id, patient_id

Question 1: Query appointment table shows the

DISTINCT

Question 2:

SELECT DISTINCT medication_name, dosage FROM medications;

SELECT DISTINCT medication_name FROM medications;

Where

```
SELECT * FROM Customers
WHERE Country='Mexico';

SELECT * FROM Customers
WHERE Country='Mexico' or Country='USA';
```

I want to know all the female patients.

Question 3:

AND, OR, NOT

```
SELECT * FROM Customers
WHERE NOT Country = 'Spain';

SELECT * FROM Customers
WHERE Country='Mexico' or Country='USA';
```

I want to know a female patient and her

emergence contact named Jordan Yang.

Question 4:

IN

SELECT * FROM Appointments
WHERE status IN ('canceled', 'completed');

WHERE status='canceled' or statu='completed';

Insert

INSERT INTO table_name (column1, column2,
column3, ...) VALUES (value1, value2, value3,
...);

INSERT INTO table name

VALUES (value1, value2, value3, ...);

INSERT INTO Customers (CustomerName, City, Country) VALUES ('Cardinal', 'Stavanger', 'Norway');

CustomerID	CustomerName	ContactName	Address	City	PostalCode	Country
89	White Clover Markets	Karl Jablonski	305 - 14th Ave. S. Suite 3B	Seattle	98128	USA
90	Wilman Kala	Matti Karttunen	Keskuskatu 45	Helsinki	21240	Finland
91	Wolski	Zbyszek	ul. Filtrowa 68	Walla	01-012	Poland
92	Cardinal	null	null	Stavanger	null	Norway

Delete All Records

It is possible to delete all rows in a table without deleting the table. This means that the table structure, attributes, and indexes will be intact:

```
DELETE FROM table_name;
```

DELETE FROM Customers WHERE CustomerName='Alfreds Futterkiste';

Question 5:

I want to delete a patient whose email equals to 'agross@gmail.com'

Update

```
UPDATE Customers
```

```
SET ContactName = 'Alfred Schmidt', City=
'Frankfurt'
```

WHERE CustomerID = 1;

Question 6:

I want to update a patient whose email equals to 'agross@gmail.com', his first name actually is Kevin

SQL JOIN

A JOIN clause is used to combine rows from two or more tables, based on a related column between them.

OrderID	CustomerID	OrderDate
10308	2	1996-09-18
10309	37	1996-09-19
10310	77	1996-09-20

CustomerID	CustomerName	ContactName	Country
1	Alfreds Futterkiste	Maria Anders	Germany
2	Ana Trujillo Emparedados y helados	Ana Trujillo	Mexico
3	Antonio Moreno Taquería	Antonio Moreno	Mexico

SELECT Orders.OrderID, Customers.CustomerName,
Orders.OrderDate

FROM Orders INNER JOIN Customers ON Orders.CustomerID=Customers.CustomerID;

OrderID	CustomerName	OrderDate
10308	Ana Trujillo Emparedados y helados	9/18/1996

Database Types

Relational Databases (RDBMS):

- Use structured tables with rows and columns.
- Support SQL (Structured Query Language) for data management.
- **Examples:** MySQL, Oracle Database, Microsoft SQL Server.

NoSQL Databases:

- Designed for unstructured or semi-structured data.
- Include different models like document, key-value, column-family, and graph.
- Examples:
 - Document: MongoDB, CouchDB.
 - Key-Value: Redis, DynamoDB.
 - Column-Family: Cassandra, HBase.
 - Graph: Neo4j, ArangoDB.

Decentralized Database IPFS

Security problems in Databases

- Authentication & Authorization: Passwords, biometrics, role-based access (e.g., nurses accessing only their patients' records).
- **Encryption:** Scrambling data (e.g., SSL for online forms).
- Backups & Recovery: Regular backups to prevent data loss.
- Audits: Tracking access logs to detect breaches.
